Australian Industry Risk Analysis

Workbook-backed chart report

This report consolidates the chart pack for industry risk analysis. Public ABS/RBA metrics are used wherever available. The report also uses estimated inventory days derived from ABS quarterly inventories/sales ratios rather than a direct official inventory-turnover-days series. AR/AP timing is anchored to reconstructed official PTRS publications when available, and the report now includes separate working-capital overlays for scorecard, PD, and LGD interpretation. The remaining explicit proxy or synthetic inputs are sector debt/EBITDA and ICR benchmarks, borrower archetype financials, bank portfolio exposure by sector, and bank pricing/policy settings.

Included charts

C01 Industry Risk Dimensions Heatmap

C02 Industry Base Risk Score by Sector

C03 Employment Growth by Industry

C04 Borrower Industry Risk Scorecard

C05 Indicative Pricing by Borrower

C06 Sector Concentration: Current Exposure vs Limit

C07 Industry Watchlist Trigger Count

C08 Industry Stress Test Impact

C09 AR Days Benchmark and Stress by Industry

C10 AP Days Benchmark and Stress by Industry

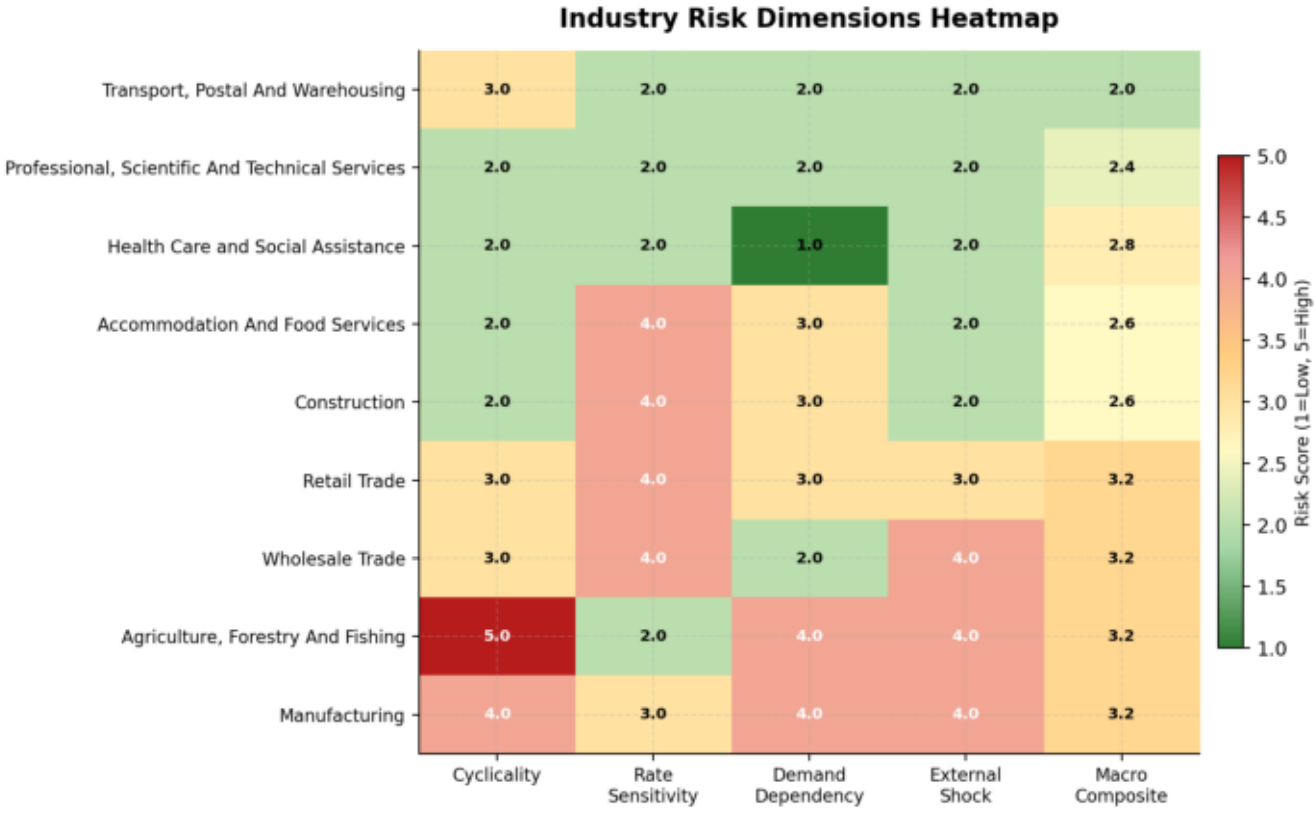
C11 Inventory Days and Stock-Build Risk by Industry

C12 Working-Capital Overlay Scores for PD, Scorecard, and LGD

C01 Industry Risk Dimensions Heatmap

Source sheet: chart_data_heatmap

Metric basis: Public ABS/RBA metrics plus public-data-derived classification scores



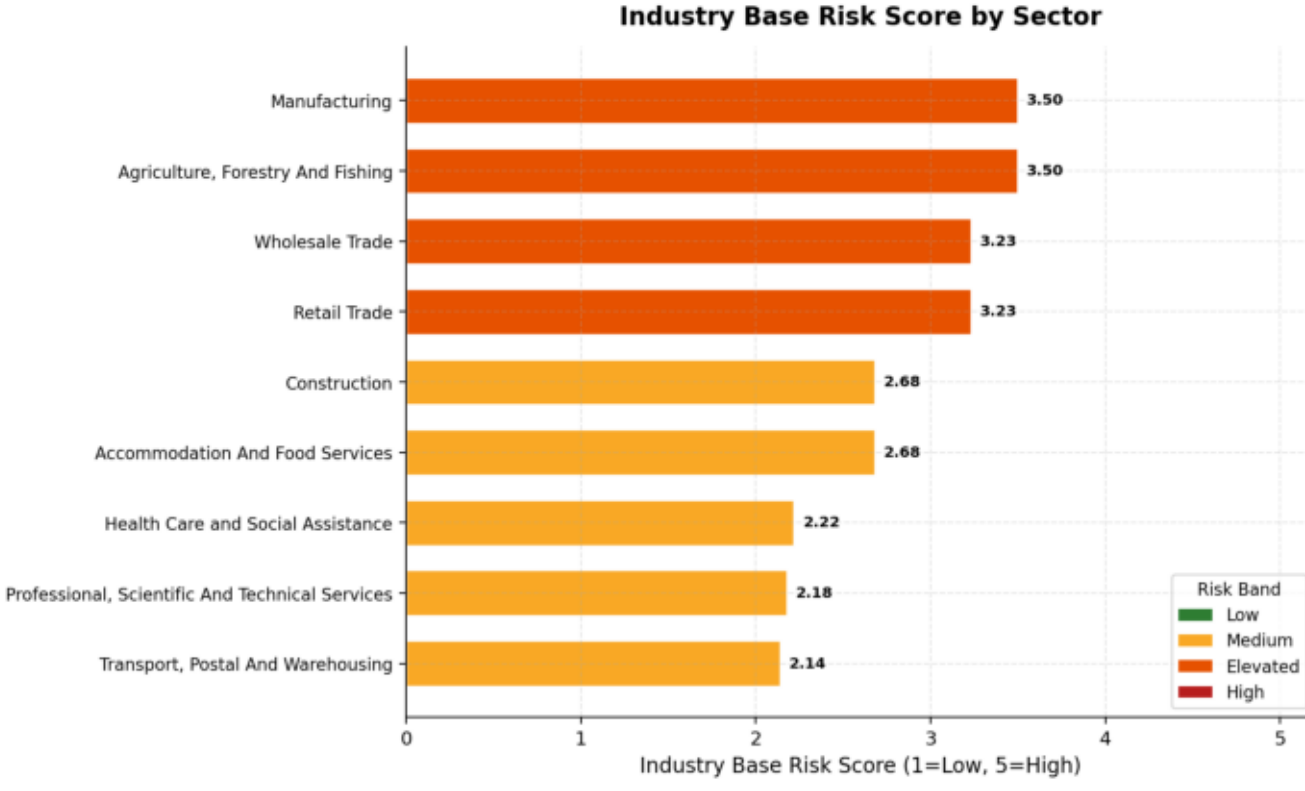
Explanation

The heatmap shows how public-data-derived classification dimensions accumulate into the industry view. In the current proxy framework, rate sensitivity is the most severe average dimension, while Agriculture, Forestry And Fishing carries the highest base score at 3.50.

C02 Industry Base Risk Score by Sector

Source sheet: chart_data_industry_s

Metric basis: Public ABS/RBA metrics plus public-data-derived classification scores



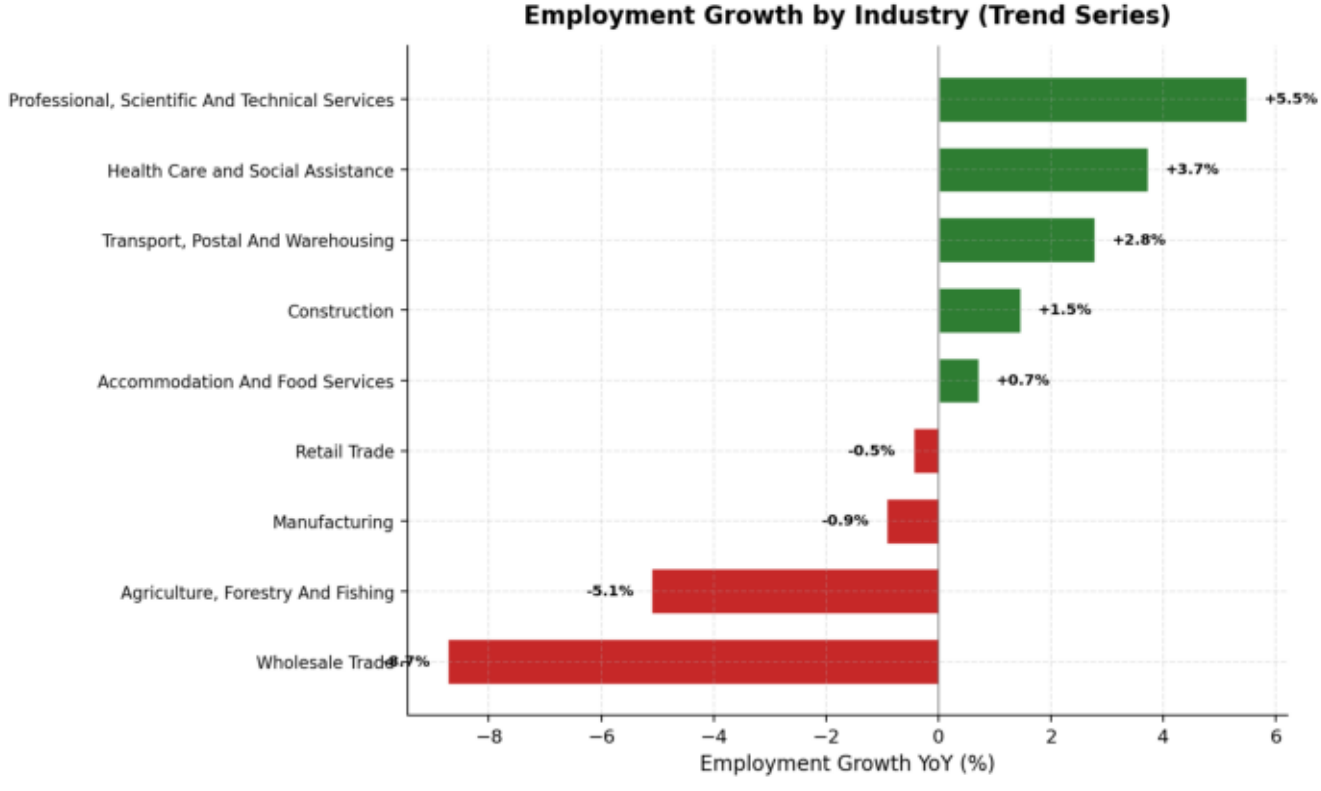
Explanation

This ranking is the core sector risk view for credit analysis. Agriculture, Forestry And Fishing is currently the highest-risk sector at 3.50, while Transport, Postal And Warehousing is lowest at 2.14. These scores combine public ABS/RBA signals with public-data-derived classification proxies.

C03 Employment Growth by Industry

Source sheet: chart_data_industry_s

Metric basis: Public ABS labour-force series



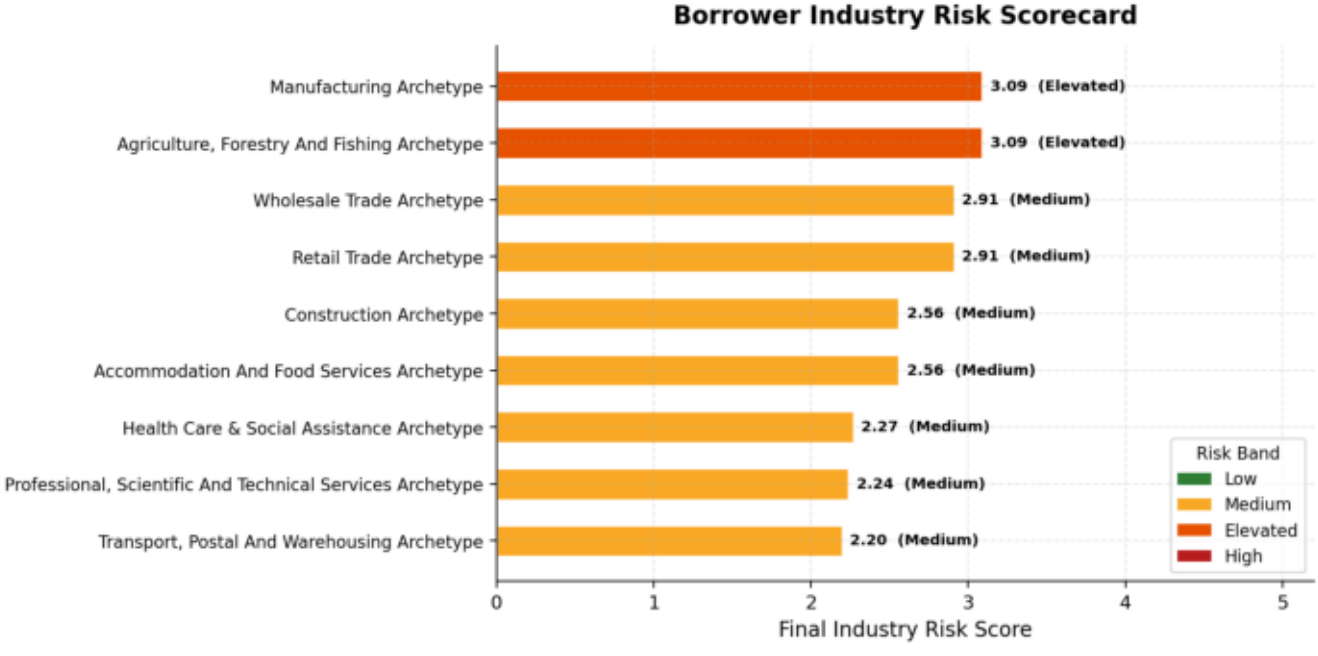
Explanation

Employment growth is one of the cleanest public signals for near-term sector momentum. Professional, Scientific And Technical Services shows the strongest YoY growth at +5.5%, while Wholesale Trade is weakest at -8.7%.

C04 Borrower Industry Risk Scorecard

Source sheet: chart_data_borrower

Metric basis: Synthetic borrower archetype financials combined with public sector metrics



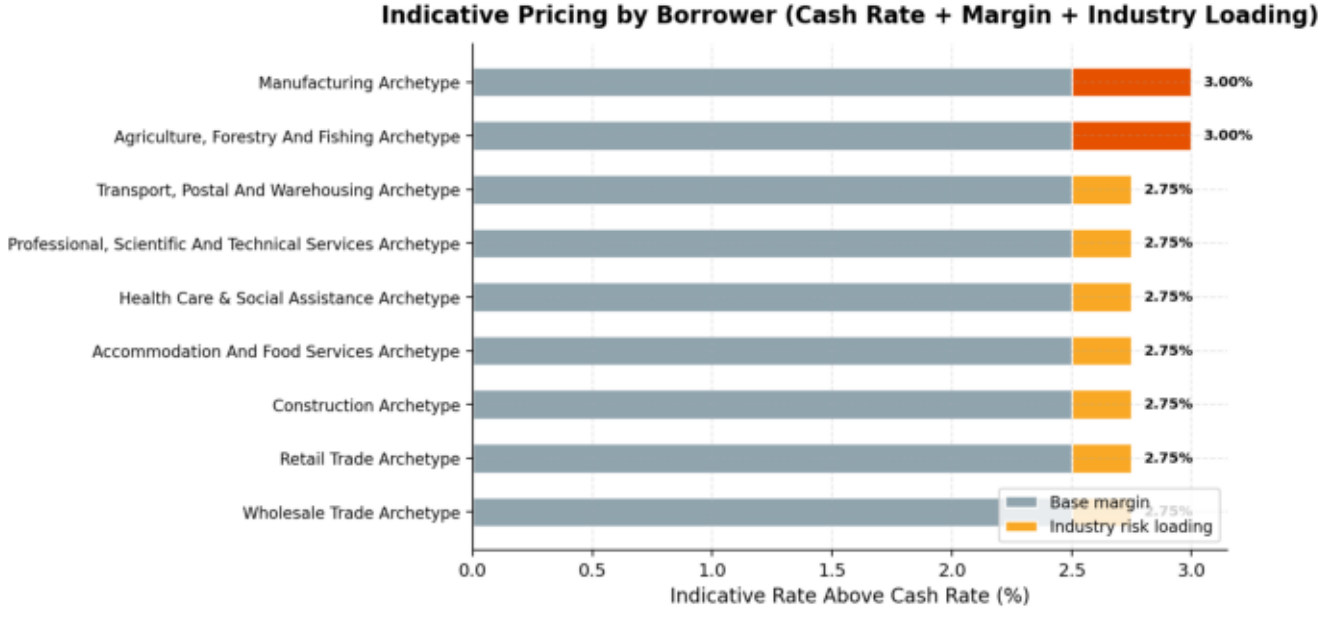
Explanation

This scorecard uses synthetic borrower archetype financial statements because borrower-level accounts are not public. Agriculture, Forestry And Fishing Archetype is the highest-risk archetype at 3.09, while Transport, Postal And Warehousing Archetype is lowest at 2.20.

C05 Indicative Pricing by Borrower

Source sheet: chart_data_pricing

Metric basis: Illustrative pricing assumptions combined with borrower score outputs



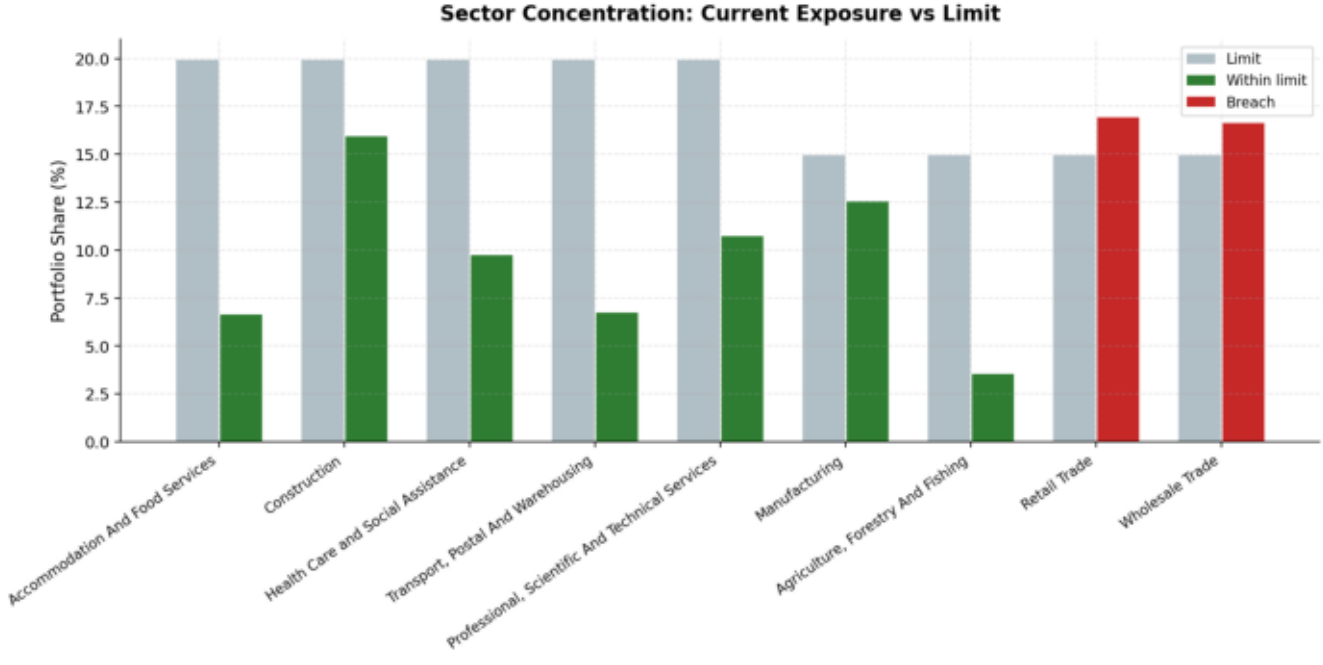
Explanation

Indicative pricing is driven by illustrative pricing settings layered onto borrower risk scores. The highest all-in rate is 6.85% for Agriculture, Forestry And Fishing Archetype, versus 6.60% for Wholesale Trade Archetype.

C06 Sector Concentration: Current Exposure vs Limit

Source sheet: chart_data_concentrat

Metric basis: Portfolio exposure proxy plus illustrative concentration limit settings



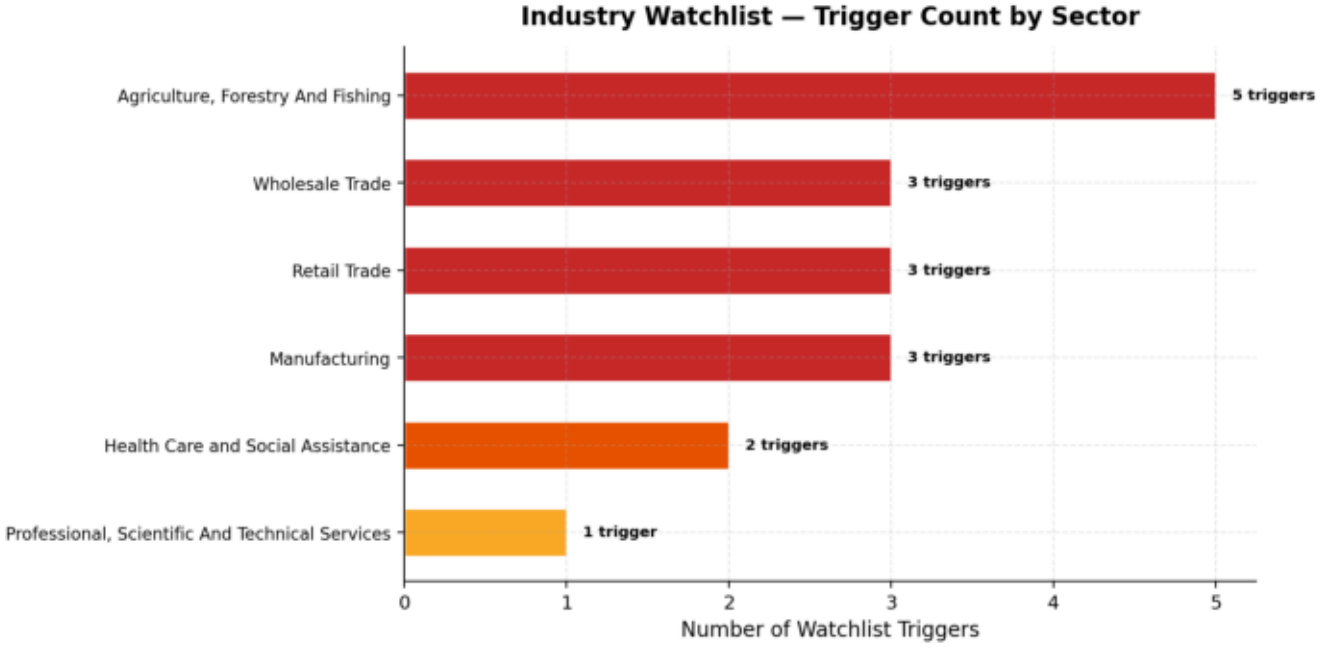
Explanation

This chart compares the portfolio exposure proxy against illustrative concentration limits. The highest utilisation is Retail Trade at 113.3% of limit. 2 sector breaches are shown, led by Retail Trade.

C07 Industry Watchlist Trigger Count

Source sheet: chart_data_watchlist

Metric basis: Public ABS/RBA signals converted into watchlist rules



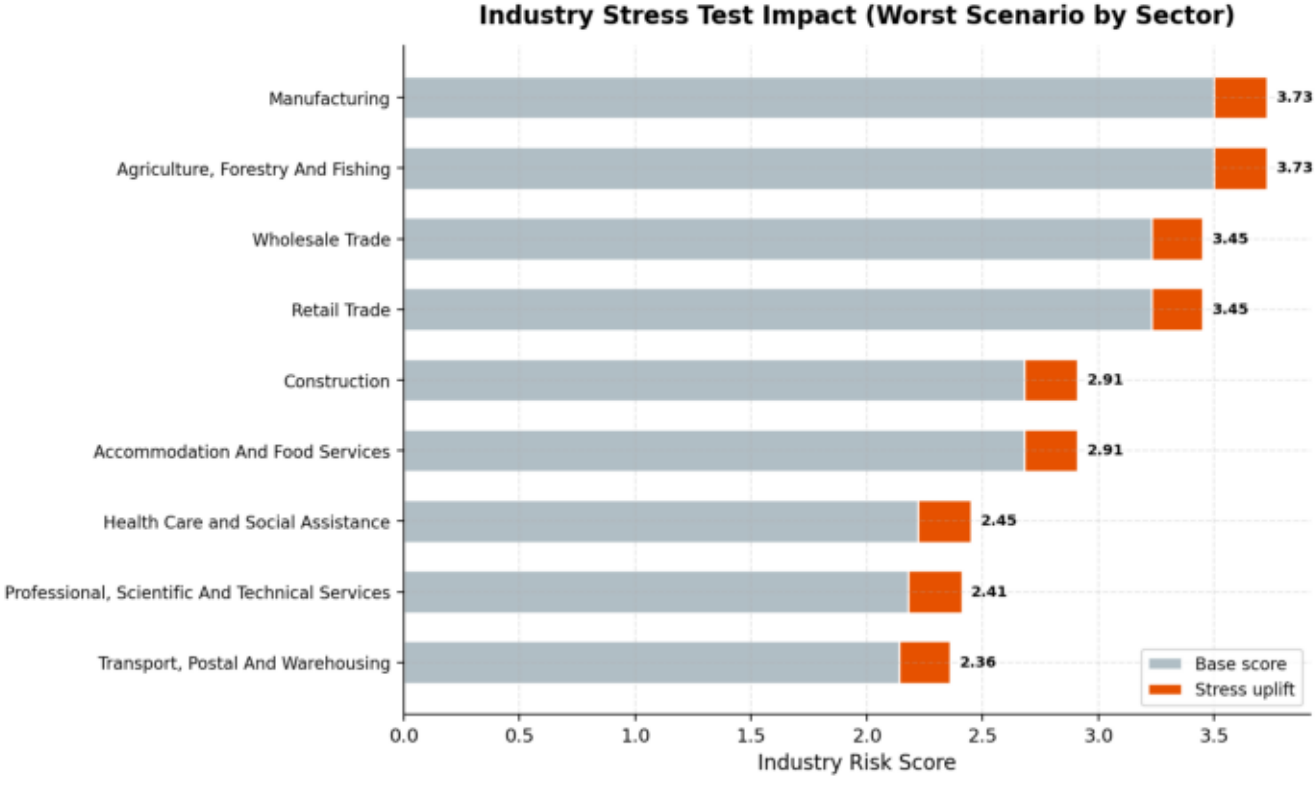
Explanation

Watchlist counts translate public ABS/RBA warning signals into a monitoring queue. Agriculture, Forestry And Fishing has the highest number of triggers at 5, which should drive intensified sector review and obligor screening.

C08 Industry Stress Test Impact

Source sheet: chart_data_stress

Metric basis: Public ABS/RBA metrics with simplified APRA-informed stress assumptions



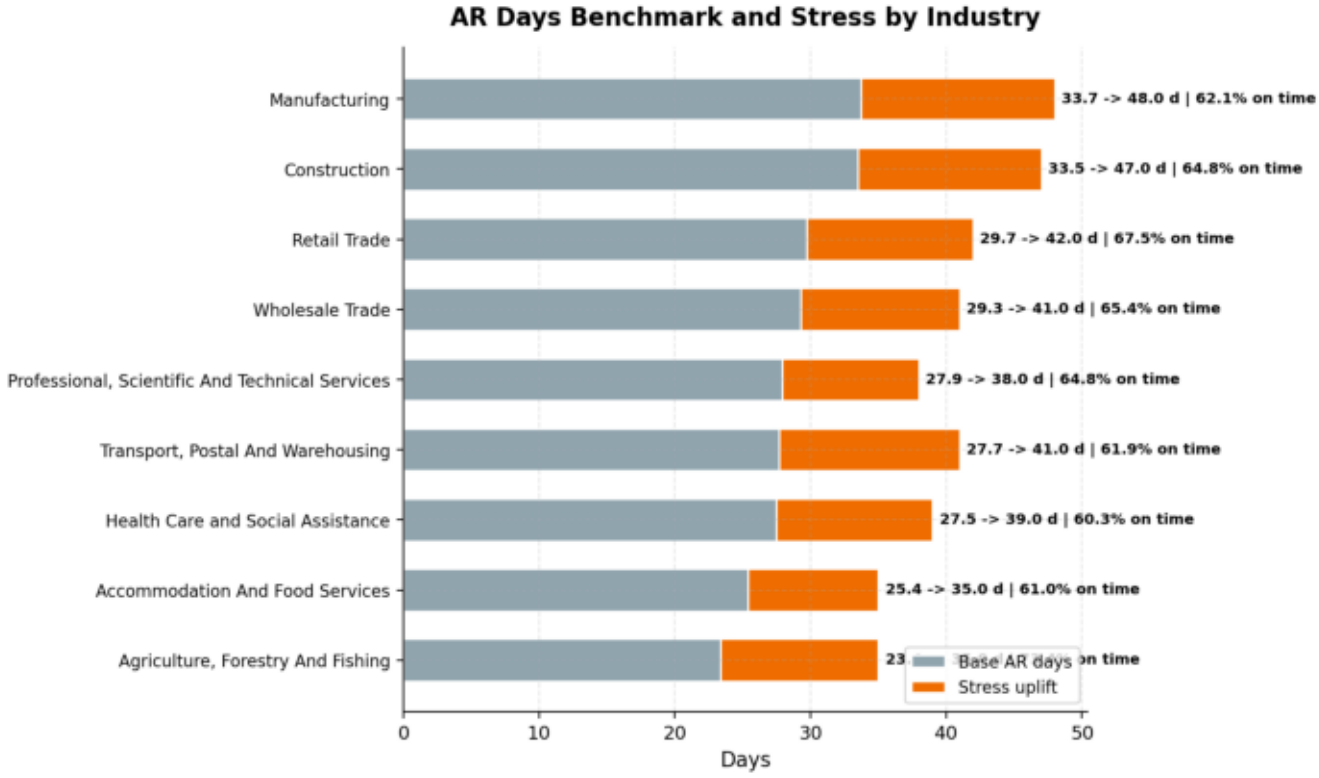
Explanation

The stress matrix applies simplified APRA-informed scenario shocks to the public-data sector view. Demand shock produces the largest average uplift at 0.23 score points, and Agriculture, Forestry And Fishing reaches the highest stressed score at 3.73.

C09 AR Days Benchmark and Stress by Industry

Source sheet: chart_data_wc_ar

Metric basis: PTRS public payment-times tables when available, otherwise fallback proxy formula



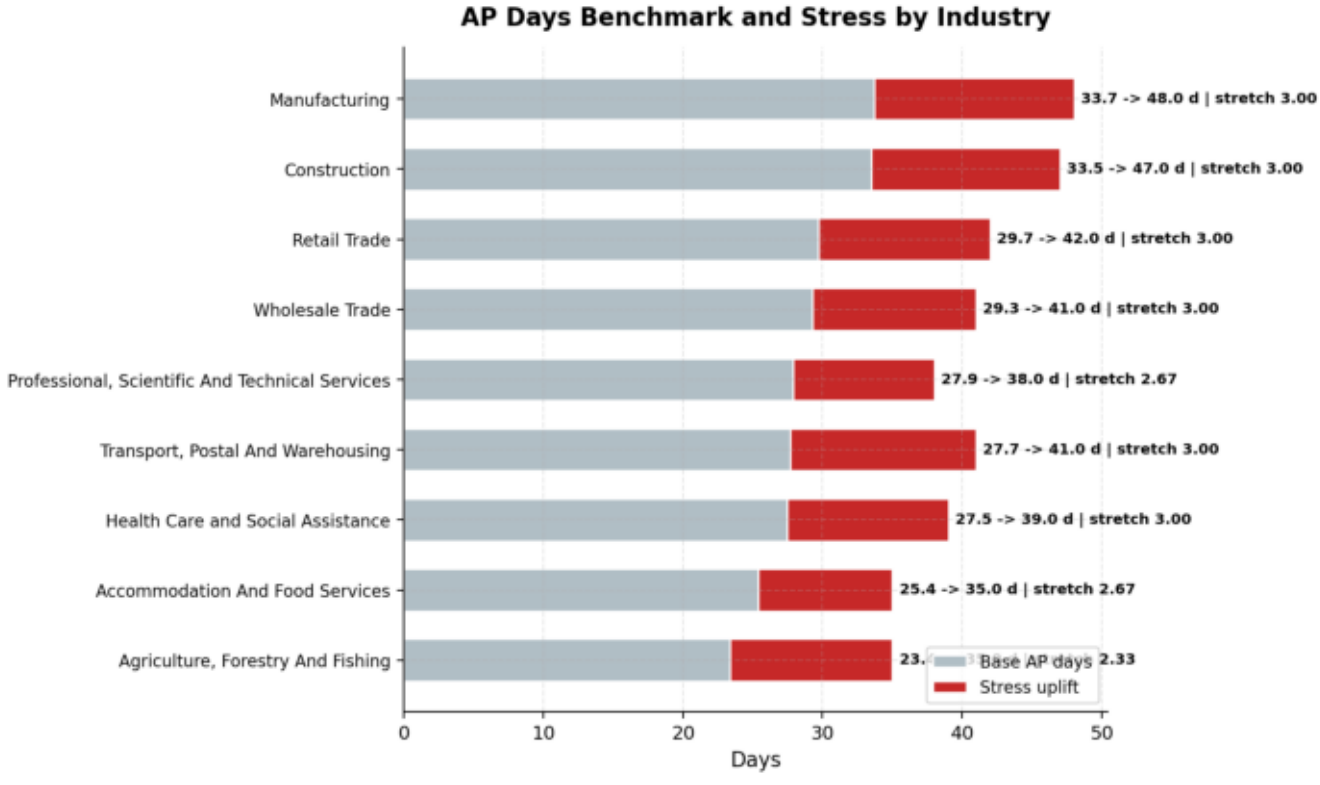
Explanation

This chart isolates receivables collection pressure from the broader scorecard. Manufacturing currently has the longest AR benchmark at 33.7 days, with a stress benchmark of 48.0 days. The chart is intended as a PD and scorecard input rather than a standalone rating model.

C10 AP Days Benchmark and Stress by Industry

Source sheet: chart_data_wc_ap

Metric basis: PTRS public payment-times tables when available, otherwise fallback proxy formula



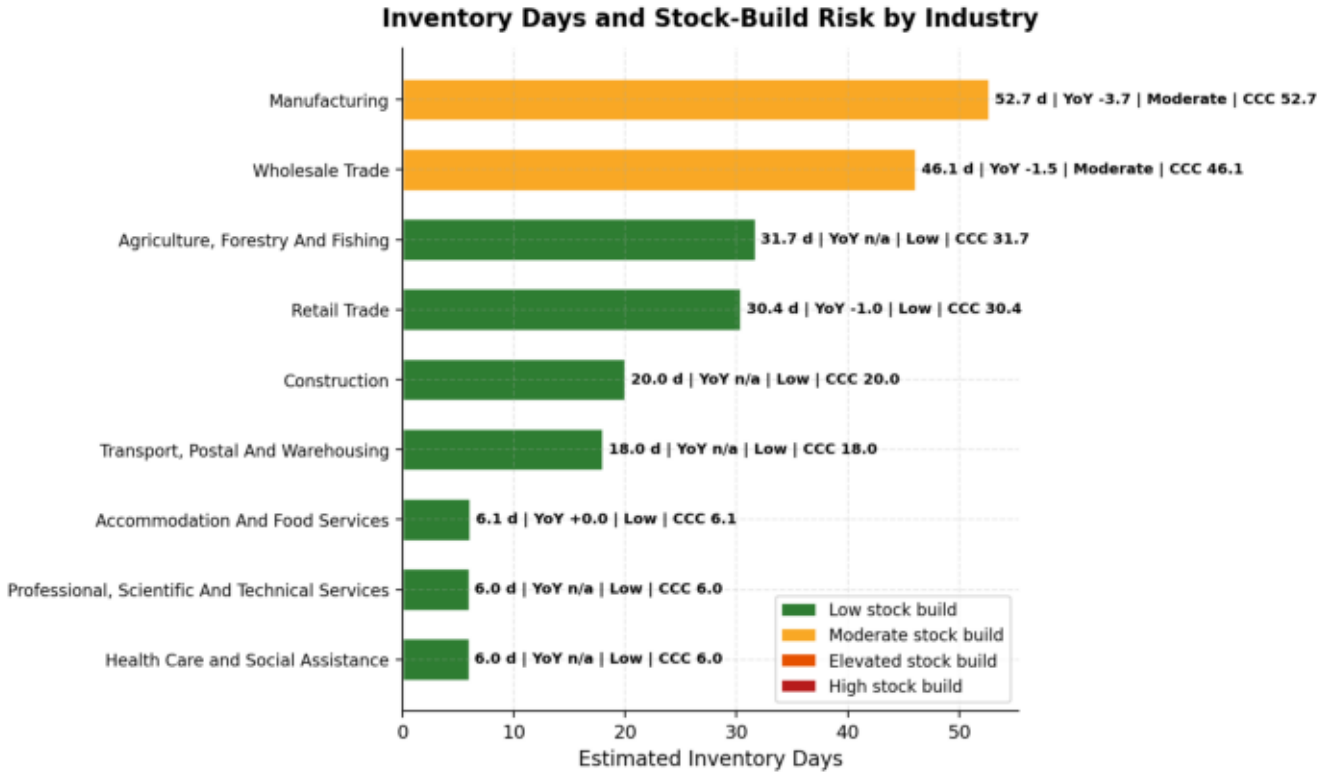
Explanation

This chart shows supplier-payment timing separately from receivables and inventory metrics. Manufacturing currently has the longest AP benchmark at 33.7 days, with the stress benchmark extending to 48.0 days. Longer payable cycles can ease cash conversion mechanically, but they can also indicate supplier stretch and emerging stress.

C11 Inventory Days and Stock-Build Risk by Industry

Source sheet: chart_data_wc_inv

Metric basis: ABS quarterly inventories/sales ratio converted to estimated inventory days plus stock-build overlay



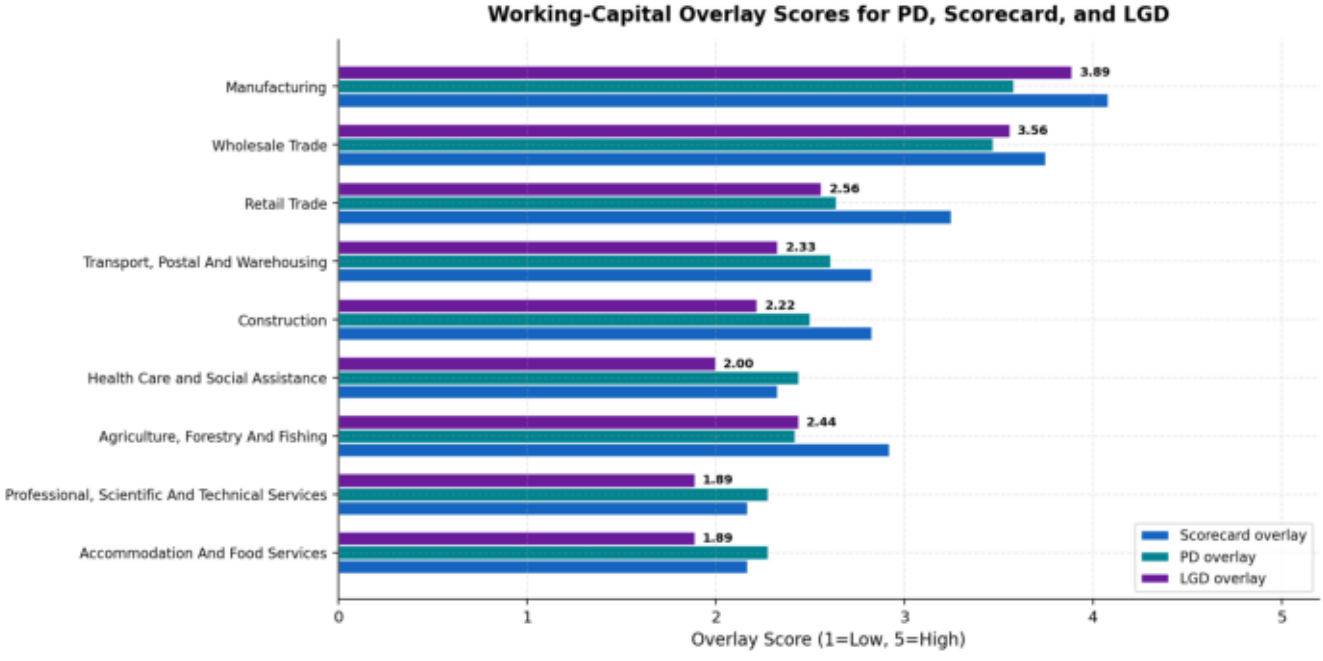
Explanation

This chart converts the ABS inventories/sales ratio into estimated inventory days and overlays the stock-build flag. Manufacturing currently has the highest inventory benchmark at 52.7 days, with a stock-build flag of Moderate. These metrics are relevant to both scorecard quality and eventual LGD thinking because they influence inventory liquidity and working-capital lock-up.

C12 Working-Capital Overlay Scores for PD, Scorecard, and LGD

Source sheet: chart_data_wc_overlay

Metric basis: Deterministic overlay scores derived from AR, AP, inventory, and cash-conversion-cycle metrics



Explanation

This chart aggregates AR, AP, inventory, and cash-conversion-cycle signals into separate overlay scores for scorecard use, PD interpretation, and LGD interpretation. Manufacturing has the highest scorecard overlay at 4.08, Manufacturing has the highest PD overlay at 3.58, and Manufacturing has the highest LGD overlay at 3.89.
